The transforaminal approach allows for exposure of the disc space by removing the facet joints and protecting the nerve roots. The disc space is entered and disc material is removed. The ROI-T cage is filled with bone graft material and is placed into the cage space to maintain the disc height and impart additional stability to the construct. Note that ROI-T cages must be used in conjunction with a posterior screw and rod system to properly stabilise the segments and enable fusion to occur.	Lordotic angles 0, 5 and 9 degrees. Length 30mm.
