It has the ability to correct acutely or gradually. The rapid adjust strut ends have 45 degree locking angulation with 360 degree rotation. The rapid adjust struts have unique ball and claw universal lockable joint at both ends of the strut. Two rapid adjust struts are sufficient for fracture reduction and initial stabilisation, whereas three rapid adjust struts are necessary for walking and weight bearing. Loosening of the ball claw joints allows for verification of the amplitude of angular correction and horizontal translation, magnitude of rotational correction and	Short 70 - 104mm range Medium 98 - 188mm range Long 163 - 300mm range	177324 207662		July 2019

The inner tube is attached to a spring-loaded, black knurled adjustment knob. The adjustment knob mates with the threaded rod in a manner such that the rod translates relative to the inner tube when the knob is rotated. This will provide gradual changes of overall strut length in 0.5mm increments. A reference arrow with plus sign located on the base of the adjustment knob indicates the direction of turning to perform strut elongation - distraction. With sharp tips and the stable construction, the pins can be precisely inserted into cortical bones. The pins have an additional minithread and are a hybrid composed of a screw and pin. The thread makes easy and safe removal possible after a healing period has taken place. This thread enlarges the surface of the shaft at the same time and therefore offers more stability.	3.5mm	280879		May 2018

The liner articulates with an acetabular cup and femoral head as part of a total hip arthroplasty. The liner has an inner clearance of 0.3 mm with respect to the femoral head. The outer clearance has been increased to 0.6 mm to avoid locking of the outer joint due to the interposition of fibrous tissue. The centre of the inner head is cranialized with respect to the centre of the liner (1,5 mm), to permit the self-centring of the system.
